Executive Summary

The Environmental Protection Agency-EPA Water Database is a data archive and catalogue database, that allows to discover, view and download inland, underground and marine water data for the Montenegro area.

The database was build with the support of the Italian Ministry for the Environment, Land and Sea, given to the Ministry of Sustainable Development and Tourism of Montenegro, through the Adricosm-Intermediate Project (<http://www.cmcc.it/adricosm-intermediate/>).

The project was carried out by a Joint venture between:

- EPA Montenegro
- Centro EuroMediterraneo per i Cambiamenti Climatici (CMCC), Lecce, Italy (<http://www.cmcc.it/>)
- CLU Ltd, Bologna, Italy (www.cluweb.com)

Data have been collected from EPA and different research projects (LSIEMP, Adricosm-Star - <http://gnoo.bo.ingv.it/adricosm-star/> , SeaDataNet - <http://www.seadatanet.org/>, MyOcean – www.myocean.eu)

EPA WATER DATABASE USER MANUAL

Introduction

This manual aims to explain:

- how to search and visualize data
- how to insert new data into the database.

For any problem please contact the EPA technical assistance or the developers at CMCC ([Vladyslav Lyubartsev](#))

The web application is optimized for Firefox 23.0.1 (Windows and Mac).

The Montenegro Environmental Protection Agency (EPA) Water Database contains observational and model data sets related to physical, chemical and biological properties in: river waters, groundwaters and marine waters.

- **Introduction** contains a brief description of the database;
- **Data catalog** provides an access to database content;
- **Data import** tool allows data providers to update the database content;
- **Documentation** contains the project deliverables and some other linked documents

Webmaster: [Vladyslav Lyubartsev](#)

How to browse Data Catalog

From the upper menu click on Data Catalog, a new page will appear. The left menu allows opening the branches that contain the data components.

The screenshot shows the 'EPA Water Database' interface for the 'ADRICOSM-INTERMEDIATE project'. The top navigation bar includes links for Home, Introduction, Data catalog, Data import, and Documentation. On the left, a tree-like structure lists data components: In situ water and marine monitoring data, Satellite sea surface data, Numerical model outputs, and Historical documents. The main content area, titled 'Data catalog', explains that the dataset list is presented on the left as a tree-like structure with expanding/collapsing branches, and instructs the user to select any dataset to display its content on the right.

The data Catalogue consists of four major components:

- In situ water and marine monitoring data
- Satellite Sea Surface data
- Numerical Model outputs
- Historical documents

In the following we will describe each item and we will see how to plot the different data,

How to plot “In situ water and marine monitoring data”

The “In situ water and marine monitoring data” are organized into two categories, listed below:

- Inland and ground water monitoring data
- Marine monitoring networks

Data in this section are collected by fixed automatic stations and/or repeated surveys at fixed locations. In the following we will describe the data contained in the two categories.

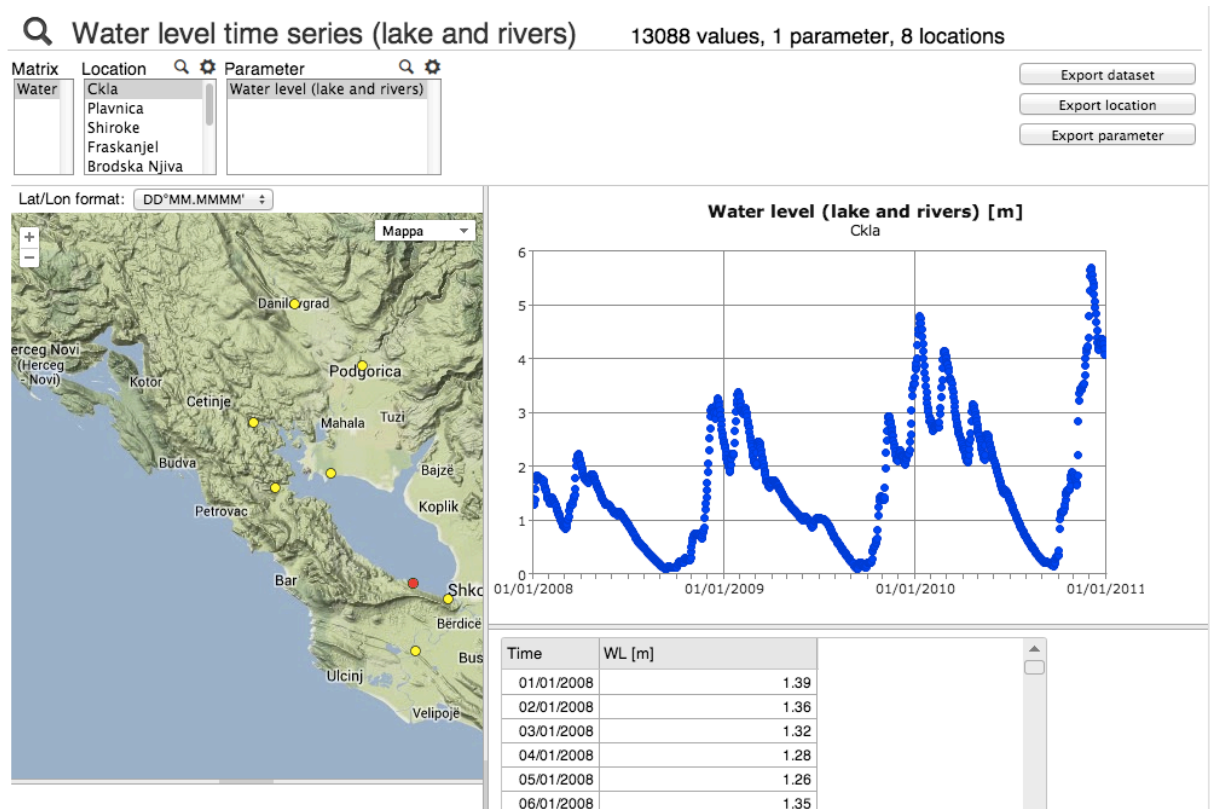

1. Inland and ground water monitoring

- Surface waters
 - Water level time series (lake and rivers)
 - Water discharge time series (rivers)
 - River water quality
 - Lake water quality
- Groundwaters
 - Boreholes

- ▼ In situ water and marine monitoring data
 - ▼ Inland and groundwater monitoring data
 - ▼ Surface waters
 - Water level time series (lake and rivers)
 - Water discharge time series (rivers)
 - River water quality
 - Lake water quality
 - ▼ Groundwaters
 - Alluvial plain boreholes
 - Marine monitoring networks
 - Satellite sea surface data
 - Numerical model outputs
 - Historical documents

Clicking of each the last branches of the tree you reach the page to visualize data.

For example, click on Water level time series (lake and rivers). You will see the following results.

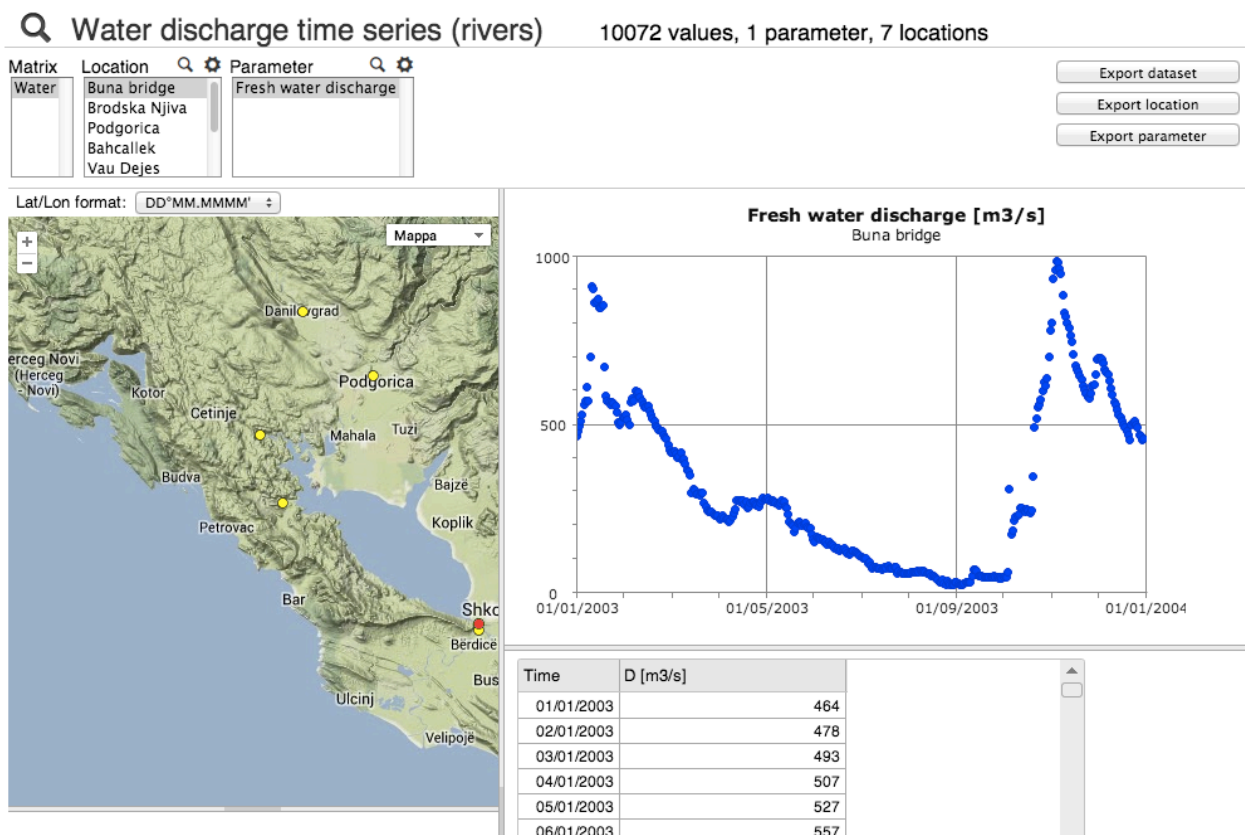

In the upper part of the page you have the following information: Name of the available matrixes, locations and parameters.

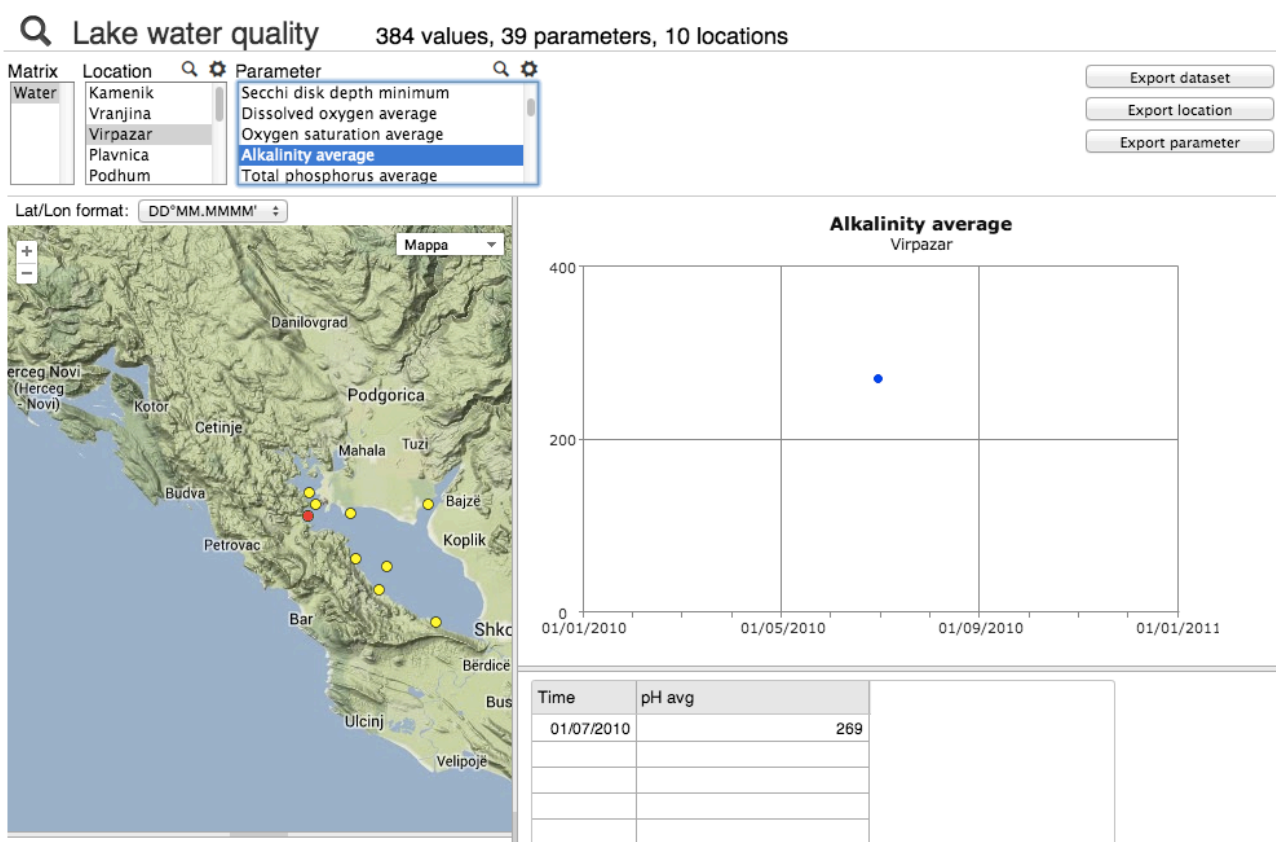

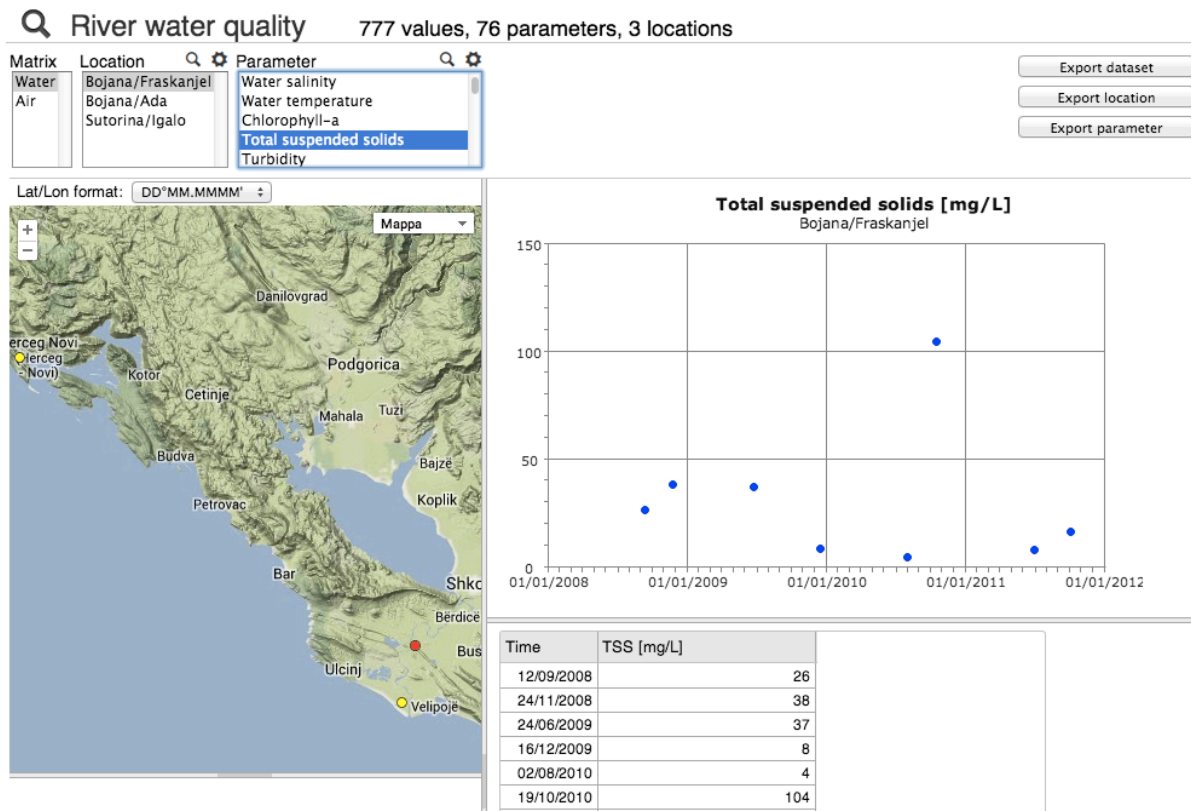

The locations are shown in the maps. The yellow circles allow directly plotting data for the selected location whilst the red is the one currently selected.

The plot changes automatically changing the matrix, the location and the parameters. The y-axis displays the parameter value and the x-axis displays the date in European format (dd/mm/aaaa).

In the bottom part of the page you can find a table with real data, which are currently plotted. A scrollbar allows the visualization to the data list.

Below you can find the screenshots for Water discharge time series (rivers), River water quality and Lake water quality pages.

Another example of visualization is the “Alluvial plain boreholes”. After you have reached this page clicking on the related link you will see the page below.

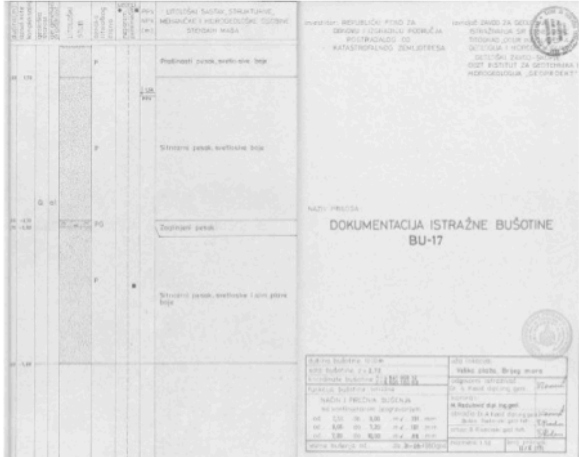

Alluvial plain boreholes

Location

- bu-17, Brijeg mora, Velika plaza
- bu-18, Donji Stoj
- bu-19, Drum, Ulcinjsko polje
- bu-20, Donji Stoj, Breg Knet

Text data file Scanned document

In the left part of the page there is a map which clickable squares referring to the different locations. From the Location menu you can change the input as well. The result is a preview of the original scanned file.

Clicking on Text data file button, you can easily save the metadata information on your computer.

- ▼ In situ water and marine monitoring data
 - ▼ Inland and groundwater monitoring data
 - Surface waters
 - ▼ Groundwaters
 - Alluvial plain boreholes
 - Marine monitoring networks
 - Satellite sea surface data
 - Numerical model outputs
 - Historical documents

How to plot “Marine monitoring networks”

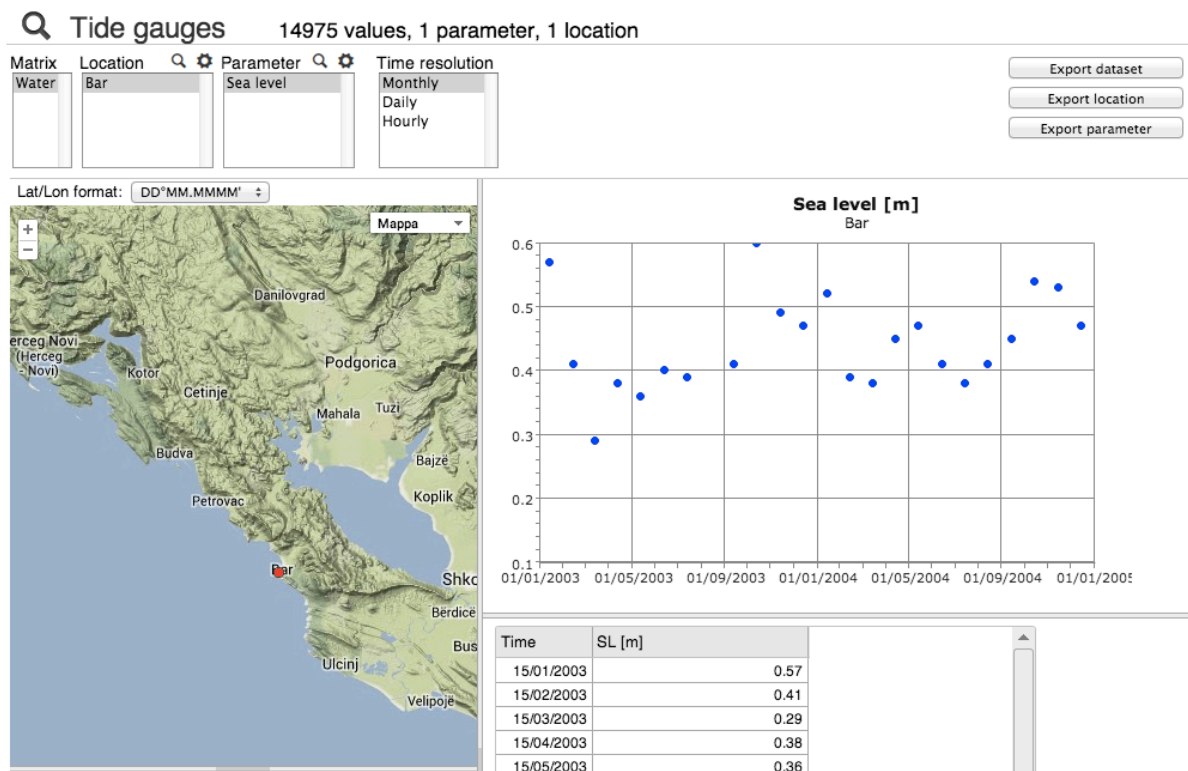

The marine network contains the following categories:

- Tide gauges
- Bathing waters
- Mariculture
- Hot spot pollution
- Environmental stress
- Coastal waters
- Eutrophication
- Oceanographic surveys
 - Sediment analysis
 - CTD data
 - CNR-ISMAR-ANCONA
 - Sediment analysis
 - XBT data
 - ENEA ADRICOSM

- ENEA ADRICOSM-STAR
- OGS
- SeaDataNet data

- ▼ In situ water and marine monitoring data
 - ▶ Inland and groundwater monitoring data
 - ▼ Marine monitoring networks
 - Tide gauges
 - Bathing waters
 - Mariculture
 - Coastal municipalities waste water discharges (hot spots)
 - Environmental stress
 - Coastal waters
 - Eutrophication
 - ▶ Oceanographic surveys
- ▶ Satellite sea surface data
- ▶ Numerical model outputs
- ▶ Historical documents

In the following example we will see how to plot the data related to these categories. For example, click on Tide Gauges. You will see the following results.

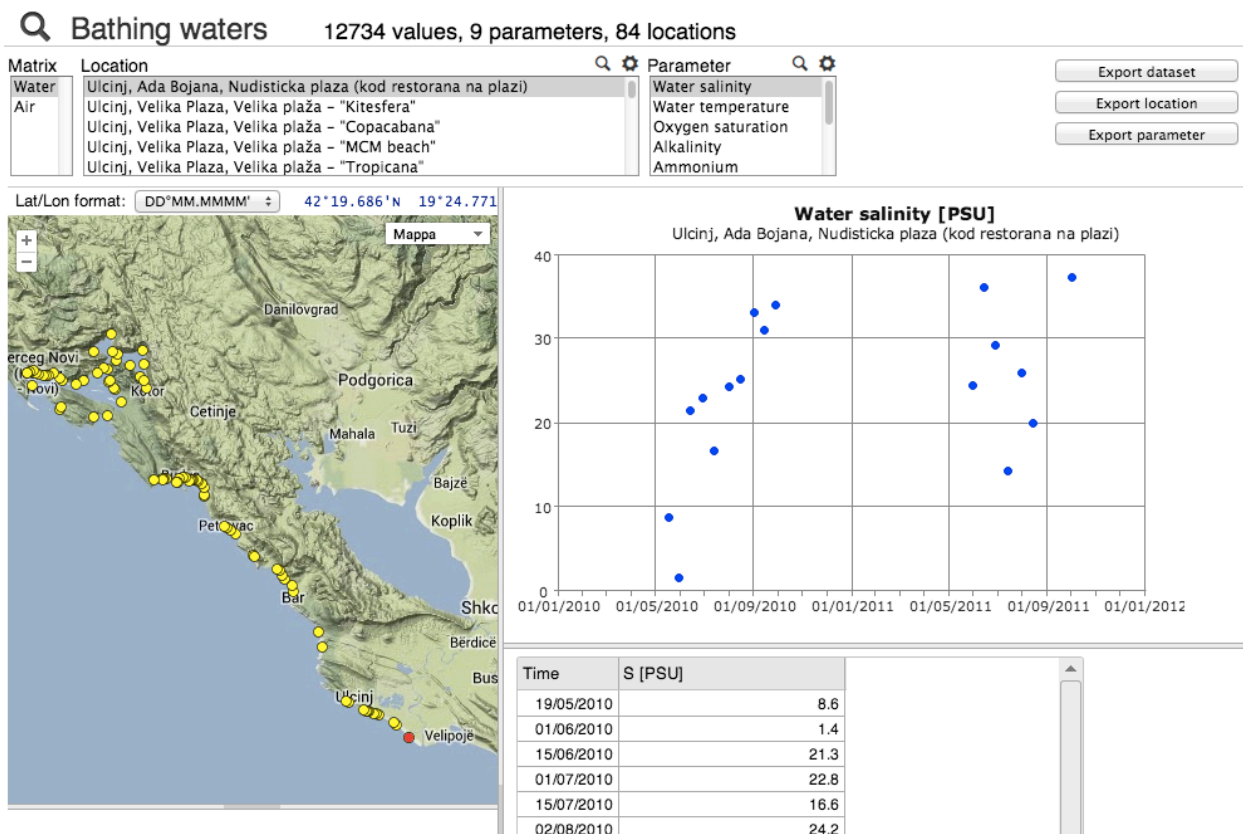

In the upper part of the page you have the following information: Name of the available matrixes, locations, parameters and time resolution.

The locations are shown in the maps. The yellow circles allow directly plotting data for the selected location whilst the red is the one currently selected.

The plot changes automatically changing the matrix, the location, the parameters and the time resolution. The y-axis displays the parameter value and the x-axis displays the date in European format (dd/mm/yyyy).

In the bottom part of the page you can find a table with real data, which are currently plotted. A scrollbar allows the visualization to the data list.

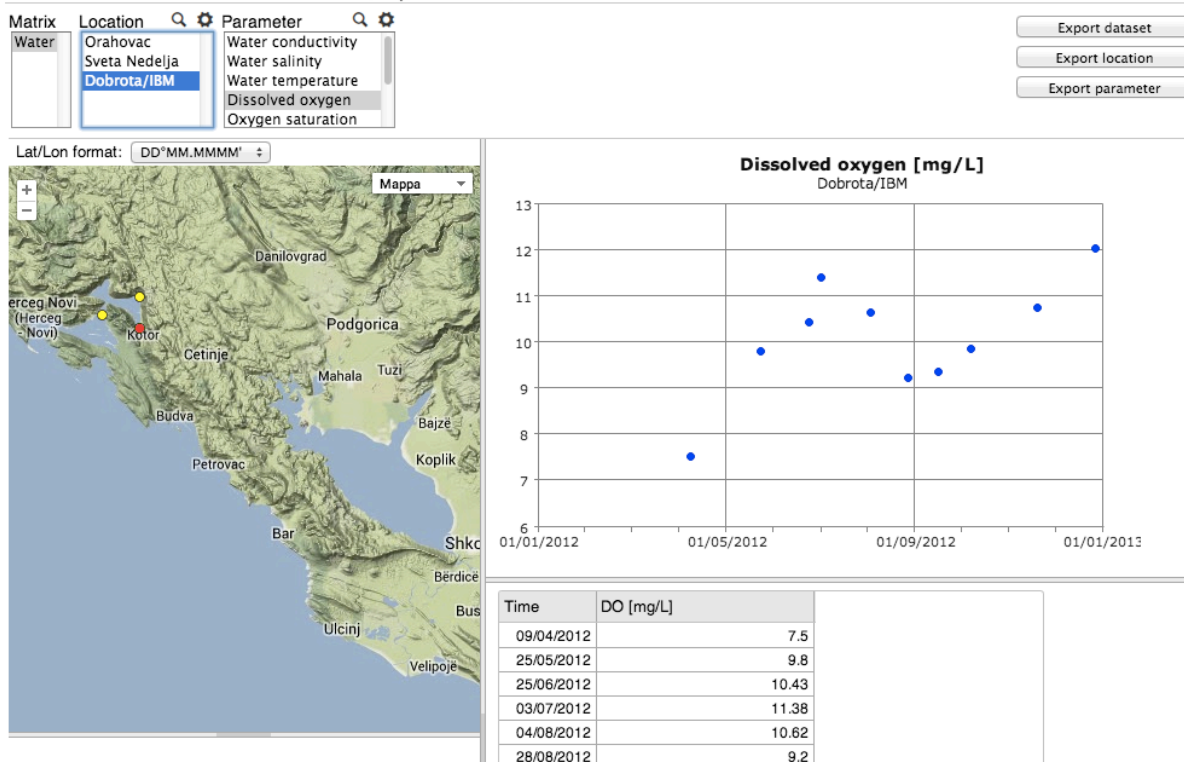

The following examples refer to Bathing water, Mariculture, Coastal municipalities waste water discharges (hot spots) and Environmental stress, where the Time Resolution option is missing.

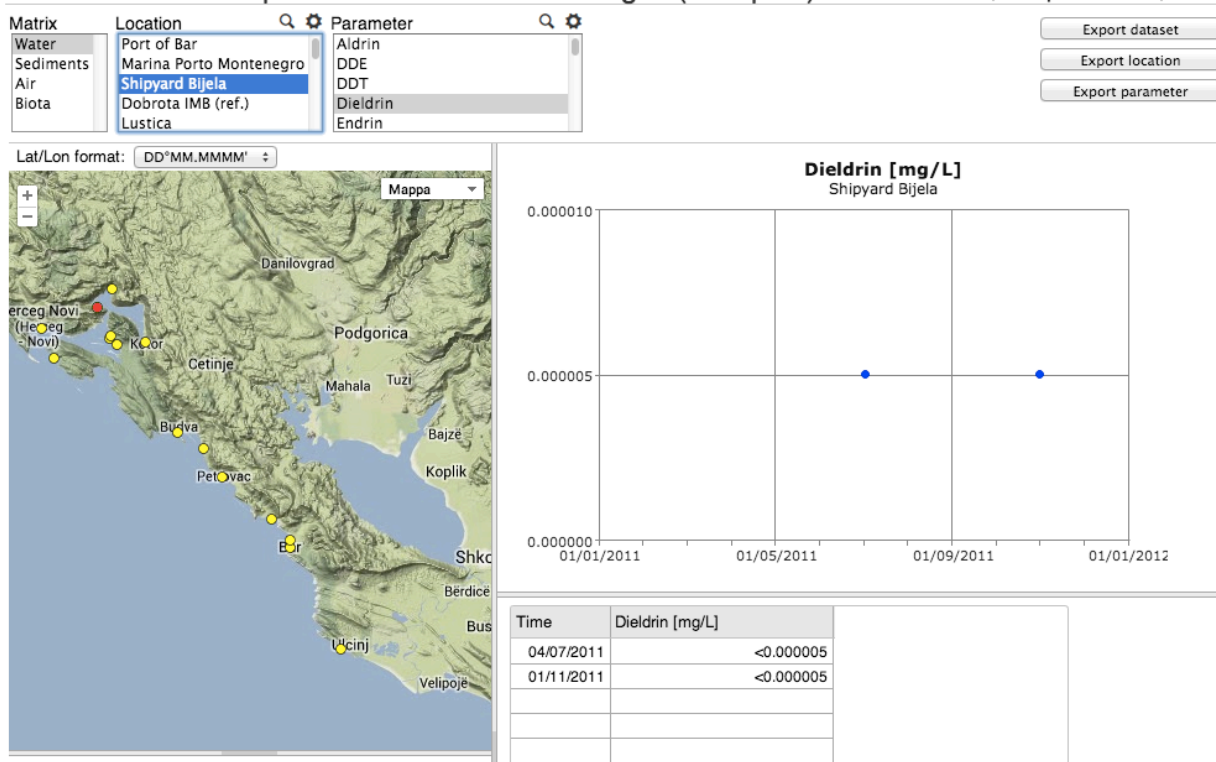

Mariculture

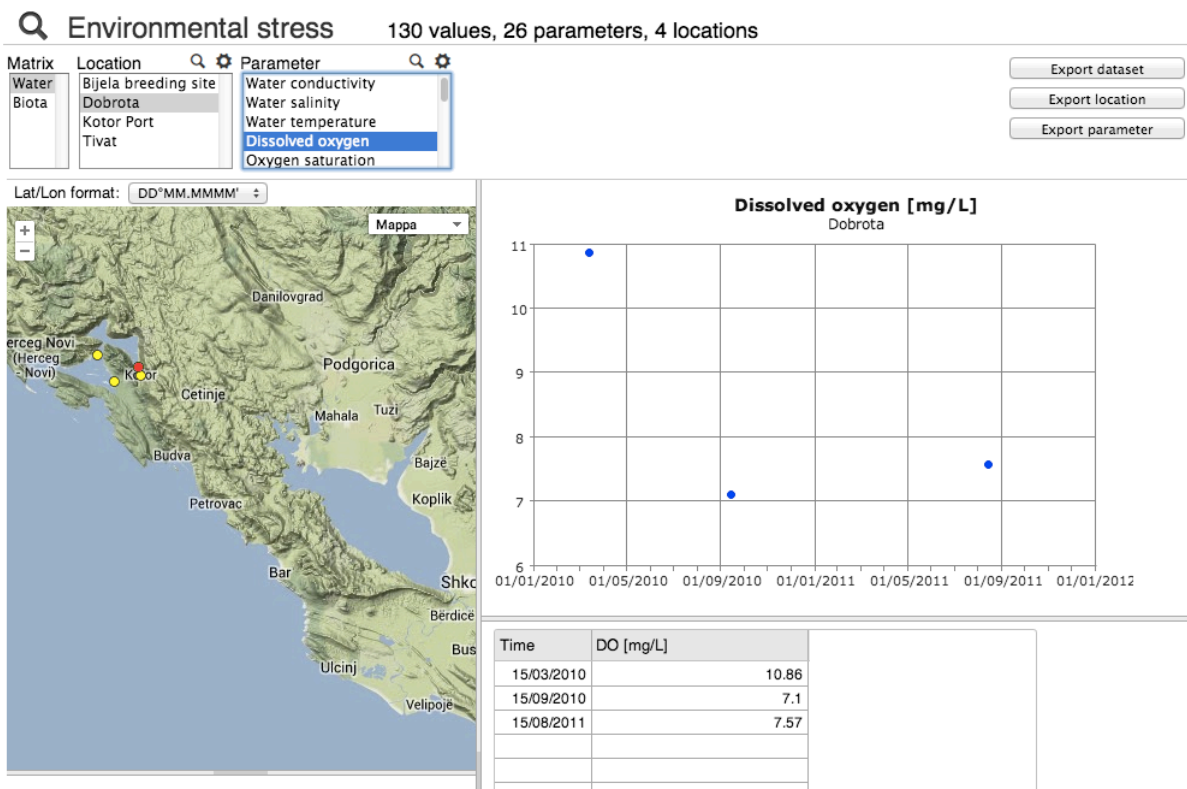

186 values, 7 parameters, 3 locations

Coastal municipalities waste water discharges (hot spots)

2828 values, 105 parameters, 15 loc

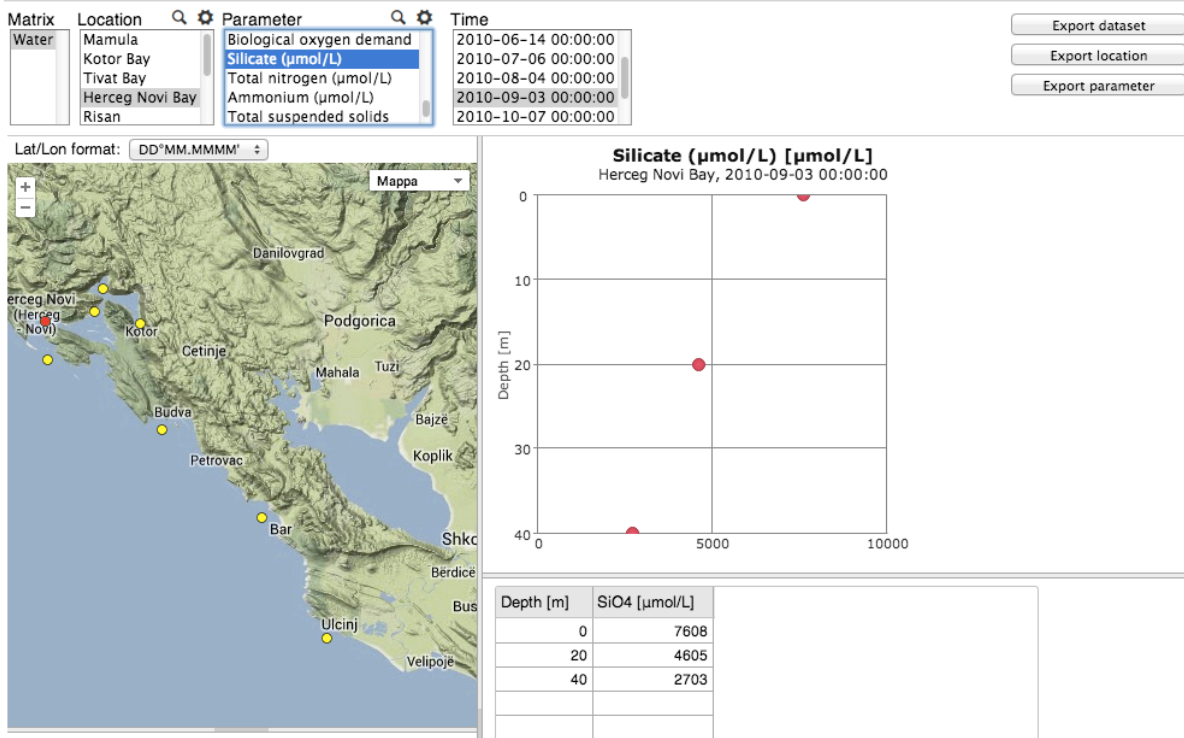

The “Coastal Waters” and “Eutrophication” can include the “Time” selection in addition to the Matrix, Location and Parameter. In this case the y-axis indicates the depth and the x-axis the value of the selected parameter.

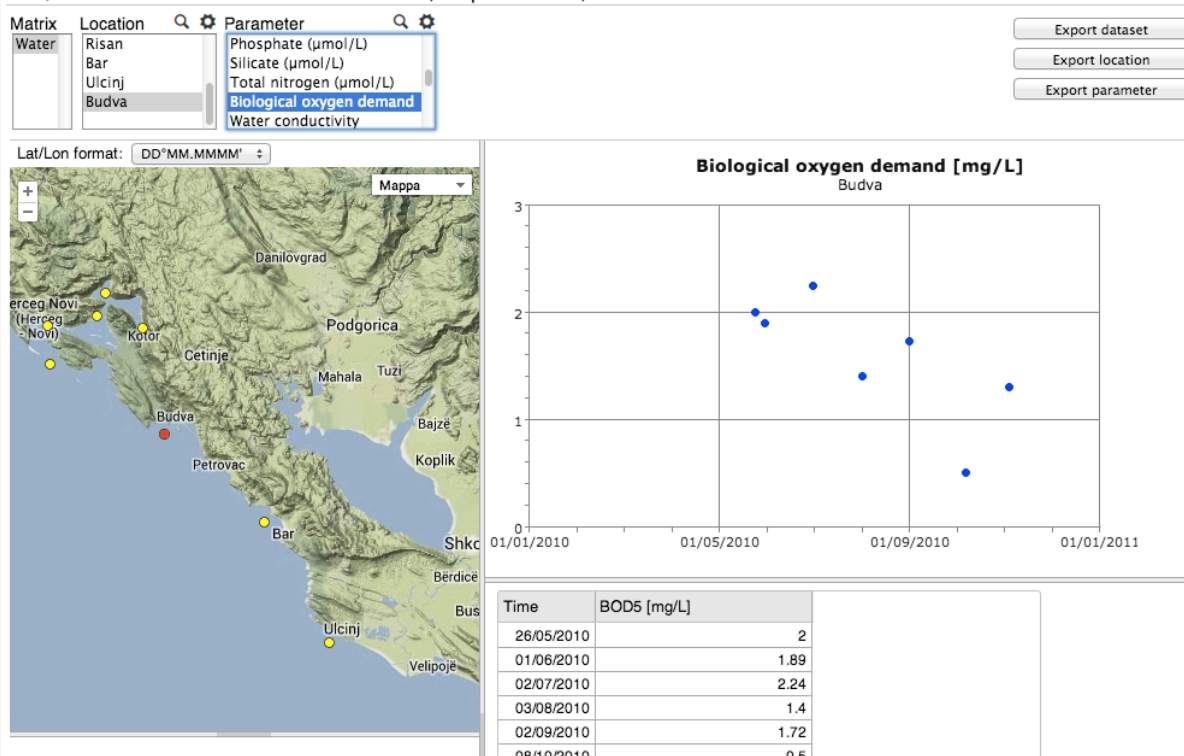

Coastal waters

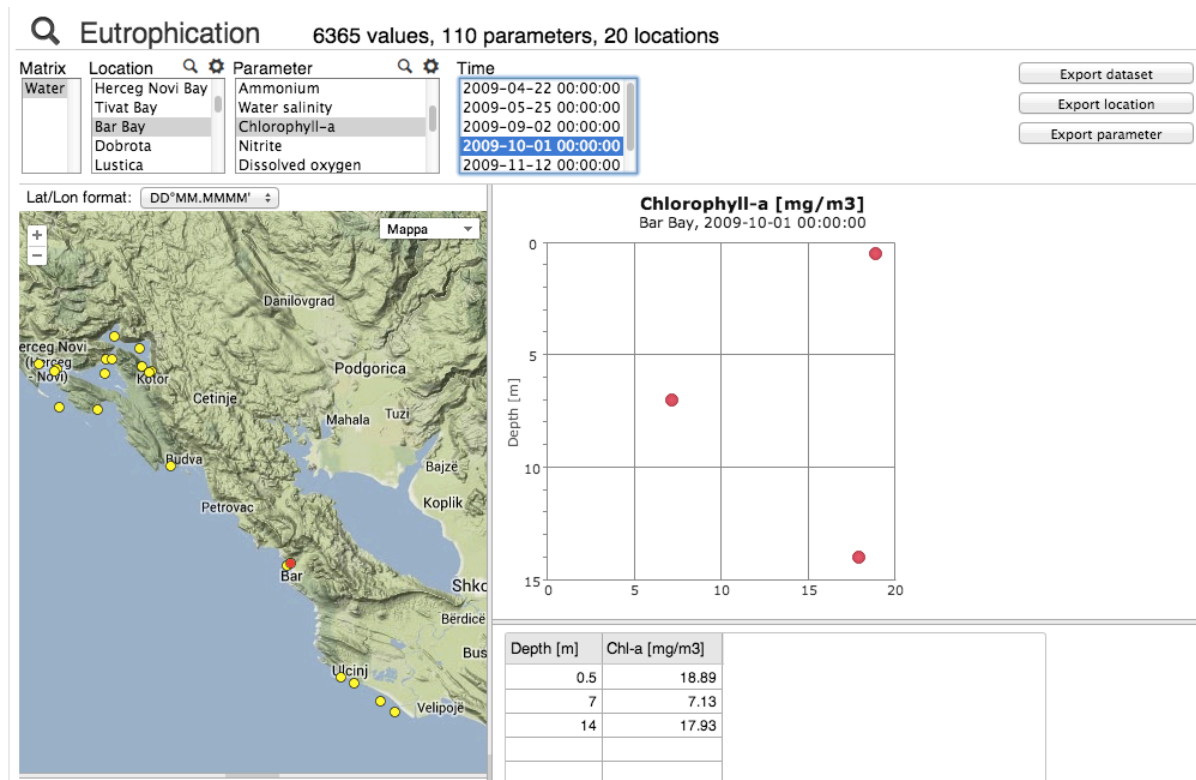

3688 values, 22 parameters, 8 locations

Coastal waters

3688 values, 22 parameters, 8 locations

The “Oceanography surveys” categories present two different kind of visualization for the “Sediment analysis “ and CTD and XBT parameters.

- ▼ In situ water and marine monitoring data
 - Inland and groundwater monitoring data
 - ▼ Marine monitoring networks
 - Tide gauges
 - Bathing waters
 - Mariculture
 - Coastal municipalities waste water discharges (hot spots)
 - Environmental stress
 - Coastal waters
 - Eutrophication
 - ▼ Oceanographic surveys
 - Sediment analysis
 - CTD data
 - XBT data
 - SeaDataNet
 - Satellite sea surface data
 - Numerical model outputs
 - Historical documents

The first example refers to “Sediment analysis “.

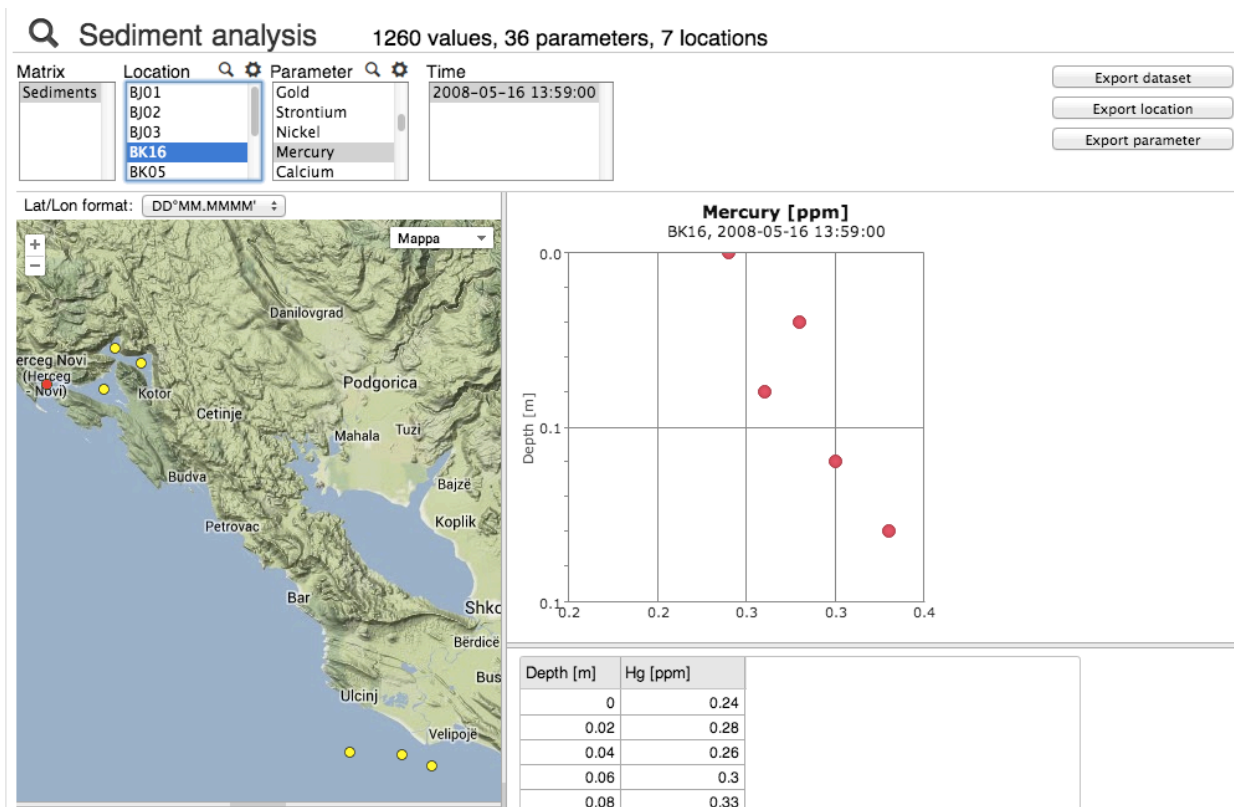

In the upper part of the page you have the following information: Name of the available matrixes, locations, parameters and time.

The locations are shown in the maps. The yellow circles allow directly plotting data for the selected location whilst the red is the one currently selected.

The plot changes automatically changing the matrix, the location, the parameters and the time resolution. The y-axis displays the depth and the x-axis displays the parameter value.

In the bottom part of the page you can find a table with real data, which are currently plotted. A scrollbar allows the visualization to the data list.

The CTD, XBT and SeaDataNet data are visualized as profiles.

Open a branch to visualize the link and click on it. You will reach a page like the one below.

- ▼ In situ water and marine monitoring data
 - Inland and groundwater monitoring data
 - ▼ Marine monitoring networks
 - Tide gauges
 - Bathing waters
 - Mariculture
 - Coastal municipalities waste water discharges (hot spots)
 - Environmental stress
 - Coastal waters
 - Eutrophication
 - ▼ Oceanographic surveys
 - Sediment analysis
 - ▼ CTD data
 - ▼ CNR-ISMAR-ANCONA
 - ADCS1
 - ADCS2
 - ADCS3**
 - ADCS3 mesoscale
 - ADSC4
 - XBT data
 - SeaDataNet
 - Satellite sea surface data
 - Numerical model outputs
 - Historical documents

ADCS3

Parameter:

Location:

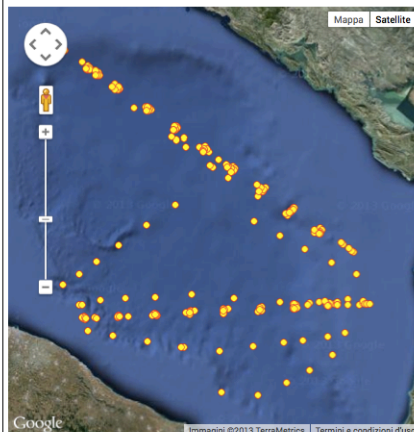

The map represents all the location for the specific campaign (i.e. ADCS3). The yellow circles allow directly plotting data for the selected location whilst the red is the one currently selected.

In the upper right part of the page you can use the two selectors to change parameters and location. The plot changes automatically changing the location and the parameter. The y-axis displays the depth and the x-axis displays the parameter value. The latitude and longitude of the profile is display both in the selected location item and under the title of the profile image.

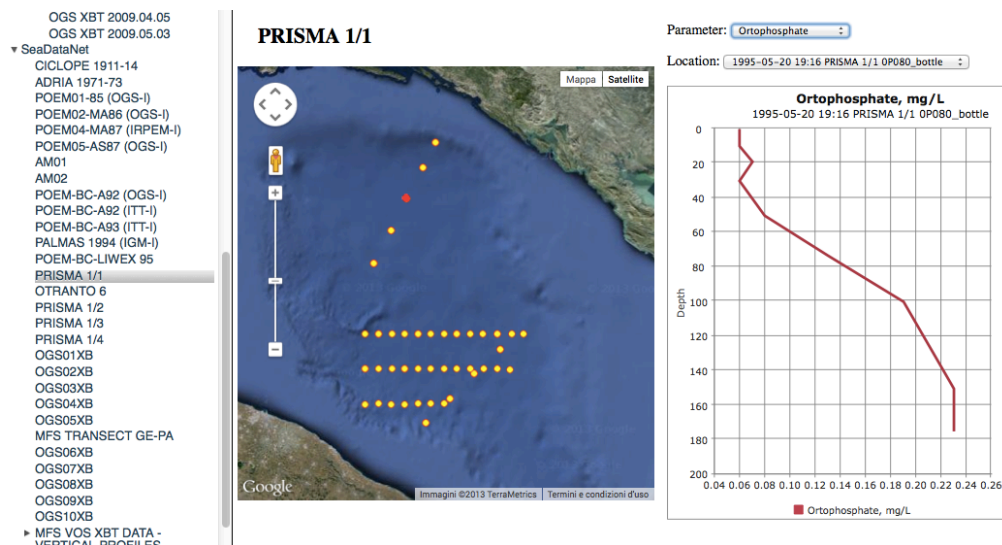

Some other examples are shown below.

- ▼ In situ water and marine monitoring data
 - Inland and groundwater monitoring data
 - ▼ Marine monitoring networks
 - Tide gauges
 - Bathing waters
 - Mariculture
 - Coastal municipalities waste water discharges (hot spots)
 - Environmental stress
 - Coastal waters
 - Eutrophication

How to export “In situ data”

Several the data set, of the “In situ water and marine monitoring data” section, include within the interface the additional feature to export data.

Three buttons are visible in the upper right part of interface: “Export Dataset”, “Export Locations” and “Export Parameter”.

“Export Dataset” button export the whole dataset, “Export Locations” button exports the data for the selected location for all the parameters available in the dataset and “Export Parameter” button exports the selected parameter for all locations available in this dataset. The output of this request is an Excel file that can be easily saved and used for further data analyses.

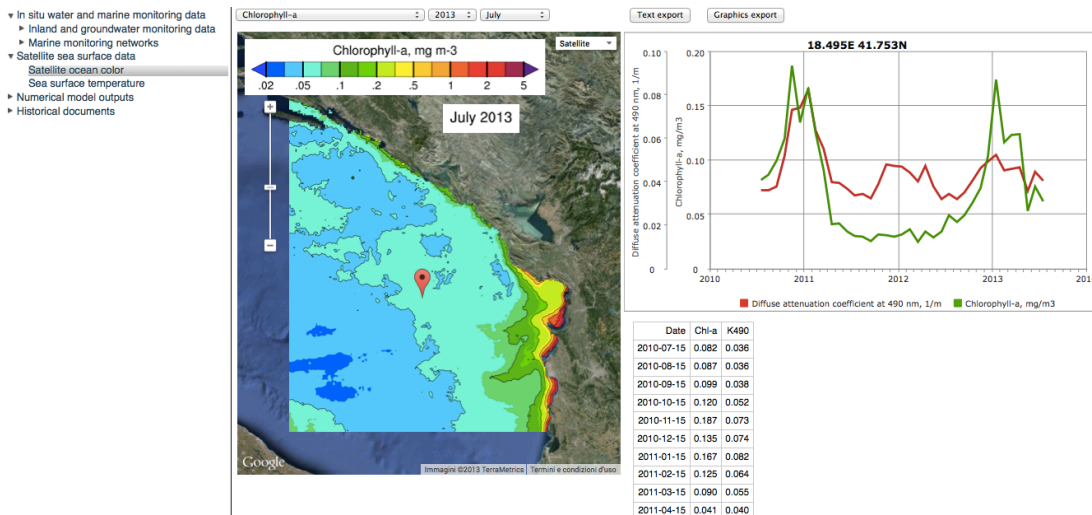

How to plot “Satellite sea surface data”

The “Satellite sea surface data” are organized into two categories, listed below:

- Satellite ocean color
- Sea surface temperature

In the following we will describe how to visualize each category data.

Open the “Satellite sea surface data” and click on “Satellite ocean color”. The page below will appear.

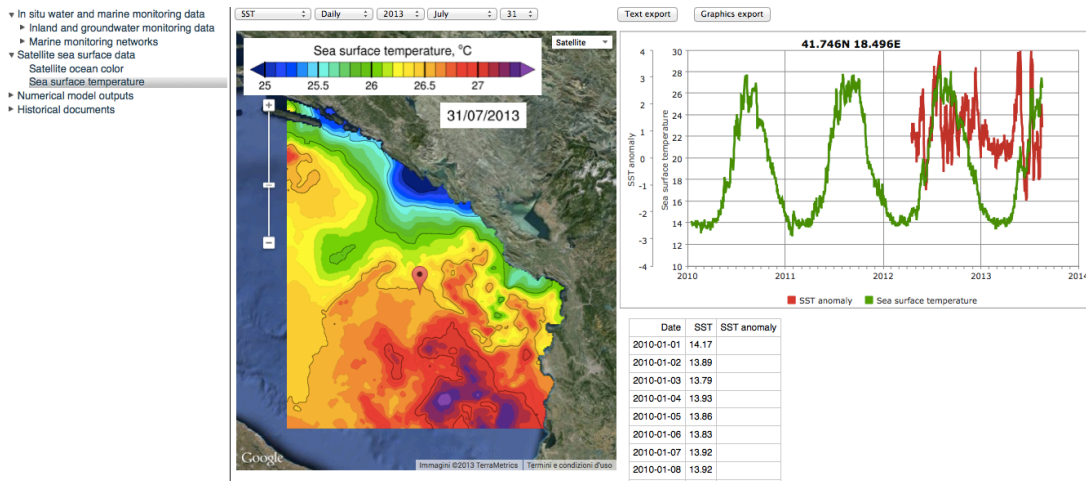

In the upper part of the page you have the following selectors: Name of the available parameters, year and month.

The image (on the left) and the plot (on the right) change automatically changing the parameter and the date. Clicking on the map the plot change accordingly. The plot displays the available parameters for the selected location. The y-axis displays the values and the x-axis displays the time.

In the bottom part of the page you can find a table with real data, which are currently plotted.

The “Sea Surface Temperature” includes additional selectors: Daily or Monthly View and the selector for days.

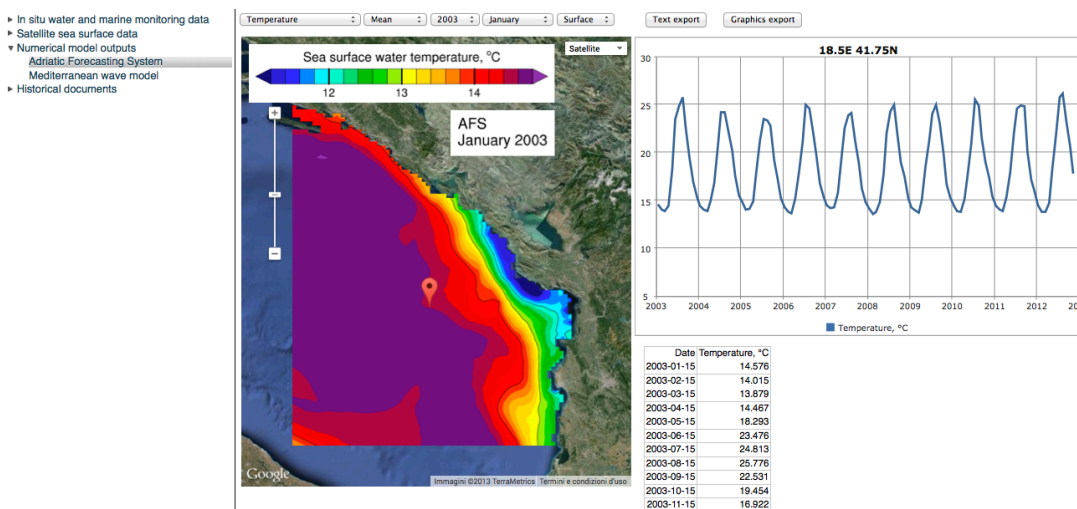

How to plot “Numerical model outputs”

The data in this section are organized into two categories:

- Adriatic Forecasting System
- Mediterranean wave model

In the following we will describe how to visualize each category data.

Open the “Numerical model outputs” and click on “Adriatic Forecasting System”. The page below will appear.

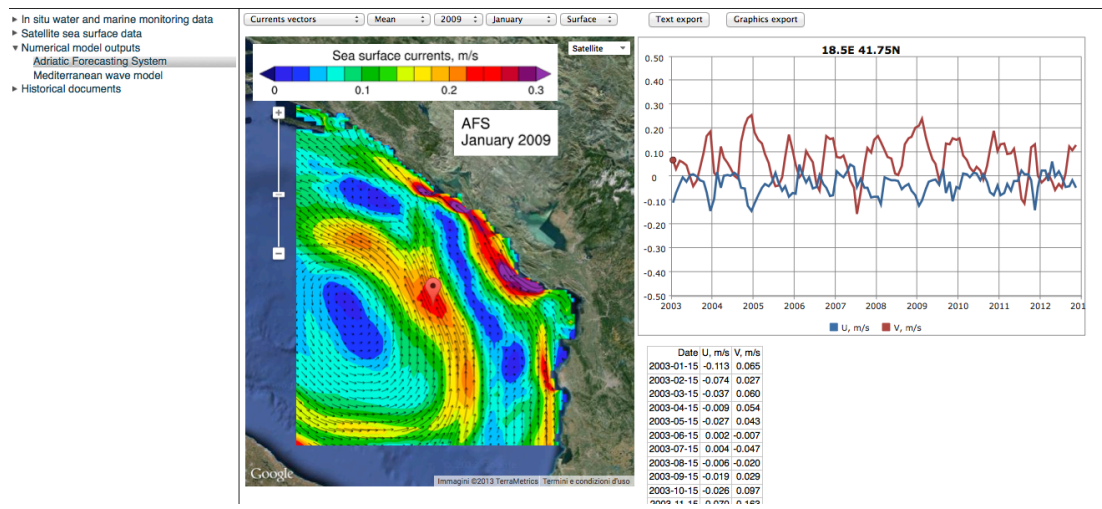

In the upper part of the page you have the following selectors: Name of the available parameters, mean or anomaly, year, month and the depth.

The image (on the left) and the plot (on the right) change automatically changing the parameter, the dates, depth or choosing mean or anomaly. Clicking on the map the plot change accordingly. The plot displays the available parameters for the selected location. The y-axis displays the values and the x-axis displays the time.

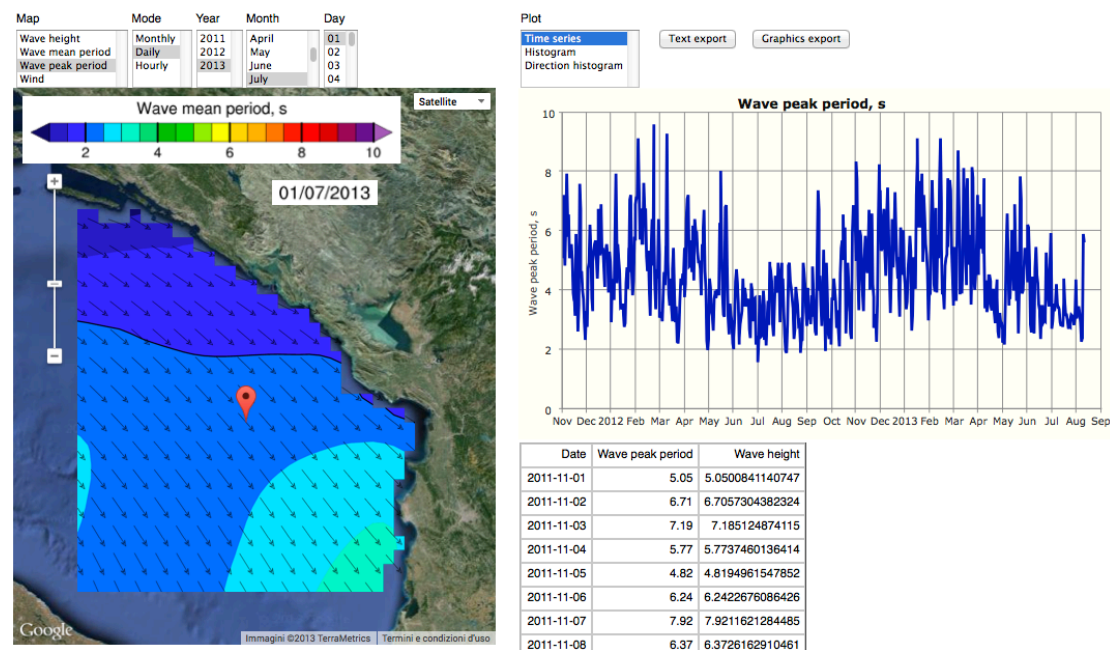

In the bottom part of the page you can find a table with real data, which are currently plotted.

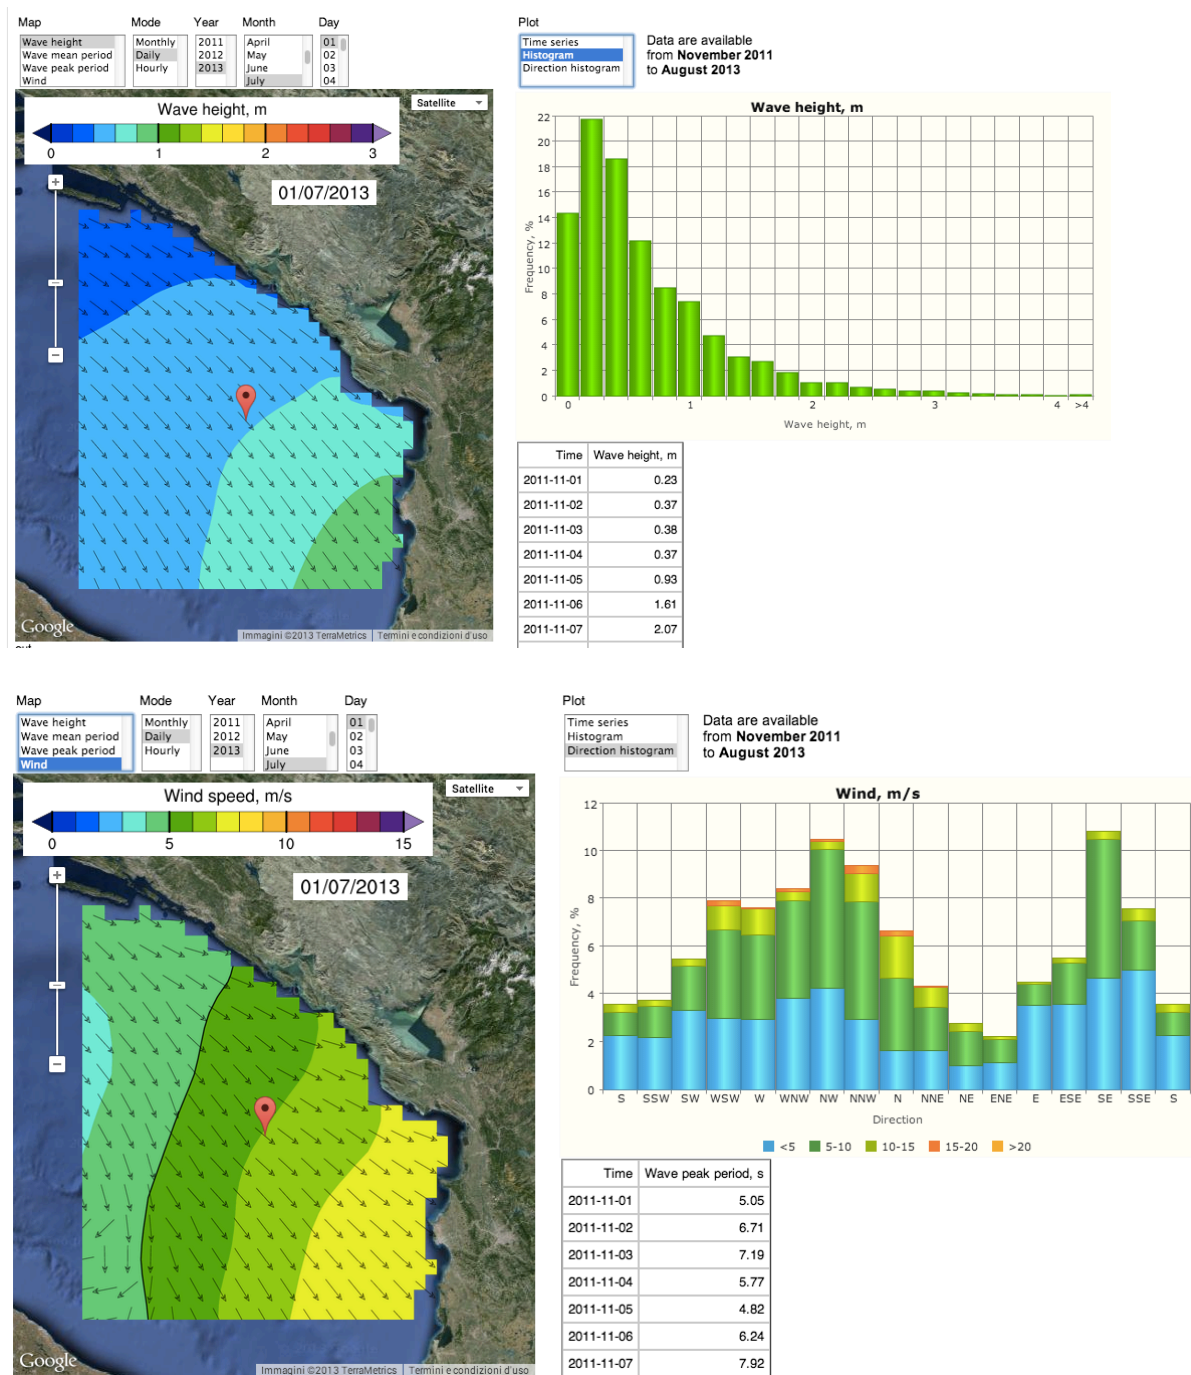

The current vector selection plots both u and v current components. See an example below.

The “Mediterranean wave model” includes an additional selector for days.

Besides you can choose if plot Time Series, Histograms or Direction Histograms.

Historical data sets

This part of the catalogue was built from the database constructed from the World Bank Project: "Lake Skadar-Shkoder Integrated Ecosystem Management Project (LSIEMP)- Development of a predictive Hydrological Model for the Skadar-Shkoder lake basin area". (Contract No: MNE-LSIEMP-TF091939-QCBS-PHM-CS-10 given to the Ministry of Spatial Planning and Environment of Montenegro).

Data contained consider historical documents made available by the Ecotoxicological Center of Montenegro (CETI) to CMCC through the Adricosm-Star Geoportal.

Adricosm – Intermediate Project

Version: V3

Date: 25 September 2013

How to insert new data

A tool, called Data Import, has been developed to allow data providers to insert new in situ data.

EPA Water Database in situ data import tool

The import tool allows data providers to upload their data into the database. Data are being checked thoroughly during this procedure to avoid any errors.

User: Password:

[Only registered users can upload data into the database.](#)

Click on Data Import link from the upper menu.

The page is password protected; please ask to the EPA technical assistance if you have not received the login information.

After you have logged in the Data Import tool, you can visualize all the in situ data already available. For each Dataset, you can see data set information.

Once selected a dataset, the related parameters and location are visualized. For each parameter and location a brief explanation is available.

Map data ©2013 Google Termini e condizioni d'uso

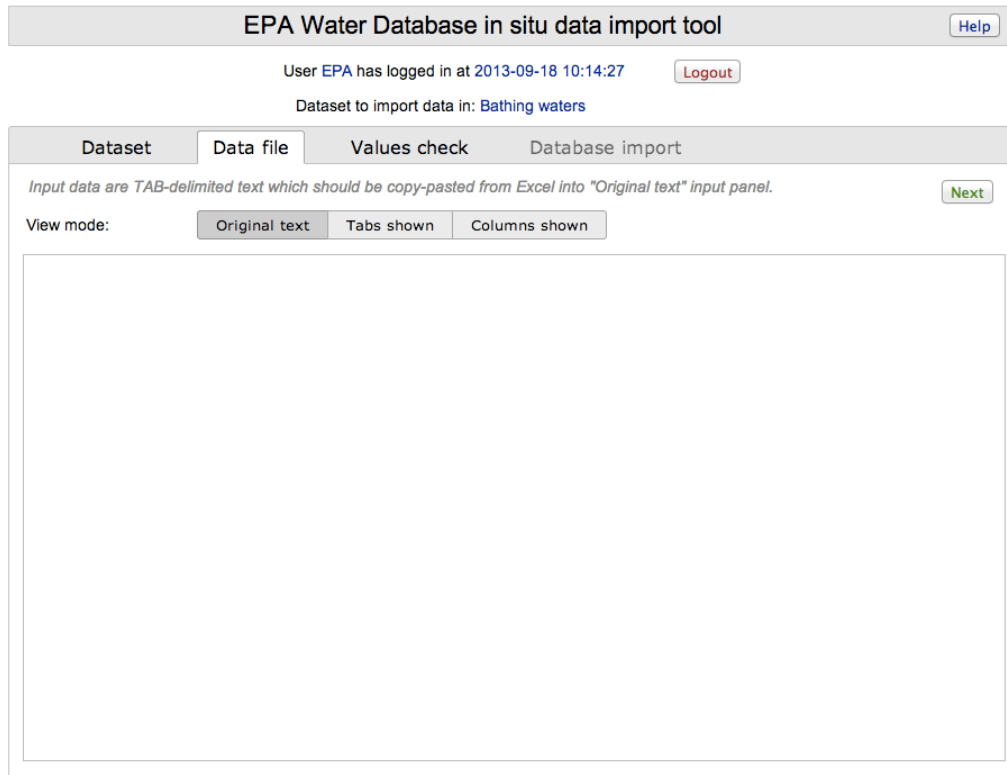

Clicking on the button Summary an overview is given for the selected database.

The map on the right part of the page gives an overview about data distribution. The red point indicates the selected location for the selected parameter. Latitude and longitude format can be changed using the drop down menu over the map.

26

To insert new data you have to select a database and then click on Next button.

Now you are into the inserting page.

The screenshot shows the 'EPA Water Database in situ data import tool' interface. At the top, there is a header bar with the title and a 'Help' button. Below the header, a status bar indicates 'User EPA has logged in at 2013-09-18 10:14:27' and a 'Logout' button. The main content area has a tabbed interface with four tabs: 'Dataset', 'Data file', 'Values check', and 'Database import'. The 'Data file' tab is currently selected. Below the tabs, there is a text instruction: 'Input data are TAB-delimited text which should be copy-pasted from Excel into "Original text" input panel.' To the right of this text is a green 'Next' button. Below the instruction, there is a 'View mode:' label followed by three buttons: 'Original text', 'Tabs shown', and 'Columns shown'. The 'Original text' button is currently selected. The main area below these buttons is a large, empty rectangular box for pasting data.

Input data are TAB-delimited text which should be copy-pasted from Excel into "Original text" input panel.

Examples of import files are available in the "Help" page and in the Annex I of this manual.

Import file format

Import file is a text tab-delimited file. It can be created in Excel, and saved as "UTF-16 Unicode Text". Unicode option is recommended, otherwise non-Latin symbols (i.e. person/location names) can be corrupted during import file into the database.

Lines beginning with semicolon (;) are comments to be ignored during import. Comments can contain file format description, and some remarks from data providers if necessary. Data import files are uploaded to EPA Water database server and can be checked later by EPA personnel.

The first seven non-comment lines contain mandatory metadata. The next line contains column titles. Columns are separated by tabulations. The first three columns are fixed: Location, Time, Z [m]. The next columns are parameter names with the corresponding units in square brackets.

Parameters, locations, matrices

Matrix describes where samples were taken: air, biota, sediments, or water. Some datasets, for example Hot spots, contain parameter values measured at the same time and place but different samples (matrices). That is why it is necessary to mention a matrix in data files. Moreover, biota samples can be taken from different species (fish, seashells, etc), these species must be also defined in data files, for example, Matrix: Biota (*Mytilus galloprovincialis*).

Time format

Time format must be DD/MM/YYYY or DD/MM/YYYY hh:mm.

Data value format

Parameter values must be a single number (possible prefixes are < and >), or two numbers separated by \pm .

Import file templates are available for the following data network (see Annex 1 for example)

- Bathing waters
- Coastal municipalities waste water discharges (hot spots) - Biota matrix
- Coastal municipalities waste water discharges (hot spots) - Sediments matrix
- Coastal municipalities waste water discharges (hot spots) - Water matrix
- Coastal waters
- Environmental stress - Biota matrix
- Environmental stress - Water matrix
- Eutrophication - Biota matrix
- Eutrophication - Water matrix
- Lake water quality
- Mariculture
- River water quality
- Tide gauges
- Water discharge time series (rivers)
- Water level time series (lake and rivers)

Once the new excel data file is ready, copy and paste your data into the inserting text box.

Update Satellite and Model Data

The satellite and model data need to be update monthly downloading data from data provider server and insert new data information into the EPA WATER Database.

The following scripts are available to the EPA DB system administrator.

- 1) “**updater.auto.http.sh**”: this script automatically download data from the data provider to the EPA machine.
- 2) “**updater.sh**”: this script manually download data from the data provider to the EPA machine.

All the scripts can be found in the following directories: **adrint/updates**

Procedures

Automatically update

To update EPA DB automatically you need to run once per day

sh updater.auto.http.sh

The script needs to be inserted into the server crontab.

This scripts contain inside a link to the corresponding http directory:

<http://webservices.cmcc.bo.it/epa.water.db.updates>

where all updates are provided.

Manually update

To install update manually you need to download **epa.water.db.update.YYYYMMDD.zip** file from the following web address (<http://webservices.cmcc.bo.it/epa.water.db.updates>) and copy into **adrint/updates** directory, and run

sh updater.sh YYYYMMDD

for example: **sh updater.sh 20130921**

If the script ends successfully, all the new data will be available on EPA server and will be possible visualize them in the User Interface.

Besides, the updater has been also implemented to upgrade the EPA Water Database code, in case of bug fix or further developments.

The updates.log file contains the log of the former updates.

Documentation (to be revised)

This section contains the reports related to the Adricosm-Intermediate project and reports from EEA European Environmental Agency that can be of interest for coastal monitoring (European bathing water quality in 2010 and Eionet priority data flows May 2011–April 2012)

EPA Water Database documents

EEA reports

European bathing water quality in 2010

Eionet priority data flows May 2011–April 2012

Adricosm Intermediate deliverables

D1.2.1 Stakeholder Assessment Report

D3.1.1 Report on the EPA Water Database design

D5.1 First Management Report (September 2011 - June 2012)
